

PFAS IN THE AIR

PFAS have been detected in both indoor and outdoor air

OUTDOOR AIR

PFAS in outdoor air are often associated with PFAS chemical production sites or large industrial manufacturing processes that use PFAS-containing materials.

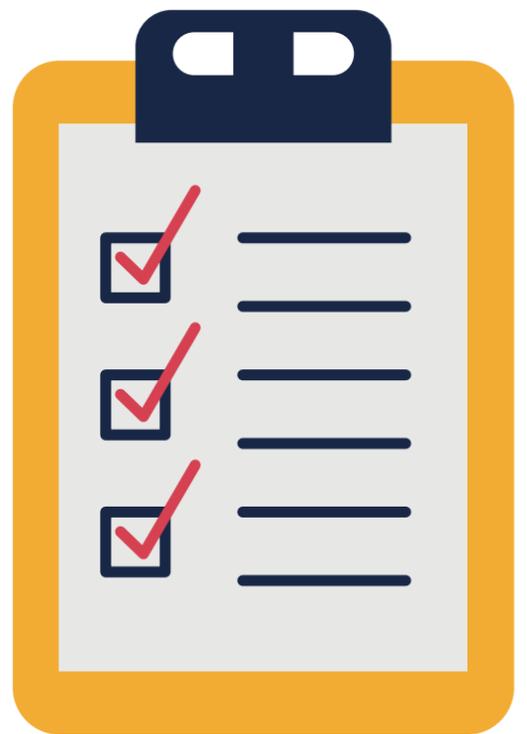

INDOOR AIR

PFAS levels in indoor air (and house hold dust) are primarily dependent on the types of consumer products used in the home. There is very limited information about associated health risks from inhalation of the various PFAS that have been found in indoor air.

PFAS IN THE AIR

Based on published literature, PFAS in air throughout the US is typically in concentrations below health-based standards (e.g., Michigan's $0.7\mu\text{g}/\text{m}^3$ 24-hour average).

The only concentrations that exceeded the health-based standards were found in areas around large manufacturing facilities for PFAS. There are no large manufacturers of PFAS in Hampton Roads Virginia.
